

Pracovní dráhy žen a mužů v době ekonomické krize.

On the sample of 4010 respondents we bring some answers to question: How the economic crisis (2008-2010) changed the status of men and women in the labor market in the Czech Republic? When analyzing the data, which provide retrospective data on the working paths of respondents focuses specifically on increasing labor market risks during the economic crisis. We especially focus on the gender dynamics of the unemployment rate growth in the Czech labor market, specifically relating to statistically documented fact that men became more victims of unemployment than women. Since economic crisis entered the labor market structured by gender inequalities and disadvantage of women women, it is necessary to explore the process started by the crisis more depth.
