

# Female genital mutilation: How many girls are at risk in Cyprus?

The screenshot shows a factsheet with a blue header containing the EIGE logo and the title. Below the header, there is a blue circular graphic with the text 'Cyprus 12-17% (7) girls at risk'. To the right of this graphic, there is a text box stating: 'It is estimated that 12% to 17% of girls are at risk of female genital mutilation (FGM or cutting) in Cyprus, out of a total population of 750 girls aged 0-18 originating from countries where female genital mutilation is practiced. Girls who are at risk of female genital mutilation in Cyprus originate mostly from Egypt, Sudan, Iraq and Ethiopia. These findings are from the latest research conducted by the European Institute for Gender Equality (EIGE) on female genital mutilation in the EU (2017)'. Below this, there is a section titled 'Female genital mutilation is a serious form of gender-based violence...' with a small image of a person on a beach. Further down, there is a section 'About the study and the European Institute for Gender Equality' and a section 'Female genital mutilation in the context of migration'.

This factsheet presents the results of the study ‘Estimation of girls at risk of female genital mutilation in the European Union – Belgium, Greece, France, Italy, Cyprus and Malta’ for Cyprus.

The study was conducted in 2017-2018. It supports the EU institutions and EU Member States in providing more accurate information on female genital mutilation and its risks among girls in the European Union.
